After your well has been drilled, you will need the following information to begin the selection of your water well submersible pump system.

How deep is your well?.....

How many gallons of water does your well produce per minute? .....

Where is the static water level,.....  
where the water comes up to ( down to water from the surface )?

After you get to the top of the well, do you need to pump the water uphill? .....

If you do, how far straight up hill rise must you pump the water? .....

Is there a longer run from the well to where the water is being pumped to? .....

How far is this run from the well top to the destination?.....

What size pipe are you pumping through? .....

Is the pipe PVC, Black Poly Coiled Pipe, Copper, or Steel? .....

When you get to the destination, what is your required gallons per minute and pressure?  
GPM ..... PSI .....

Are you pumping into a pressure tank from the well, or into a cistern to collect the water?

If you are using a cistern, you will need a pump to pressurize the house system.

We recommend the Flint & Walling CPH-05-S Shallow Well Jet Pump or a submersible pump in the cistern to supply your house.

How far from the well is the power supply for your water well pump system? .....

Call Dean Bennett Supply at 800-621-4291 to request your water well pump system catalog, and for assistance in designing your submersible water well pump system.

**Over 37 Years of Pump System Experience**

# MY SELECTED COMPONENTS

## for my submersible pump system

Submersible Pump Model.....

Pump Wire size and length.....

Distance from well to power..... Size UF wire needed.....

Well Cap size.....

Pitless Adapter needed.....

Size well pipe needed..... How many feet are needed.....

Check Valves needed..... Torque Arrestor .....

Cable Guards..... Discharge Pipe .....

Length of pipe needed.....

Pressure Tank..... Tank Fitting Kit size.....

Splice Kit for wire..... Bell Splice Box .....

Wire Nuts ..... Safety Rope.....

Pipe Setting Tools.....
